

THE MONTY HALL PROBLEM

THE MONTY HALL PROBLEM

1 of these 3 doors hides a car.
The other 2 hide goats.

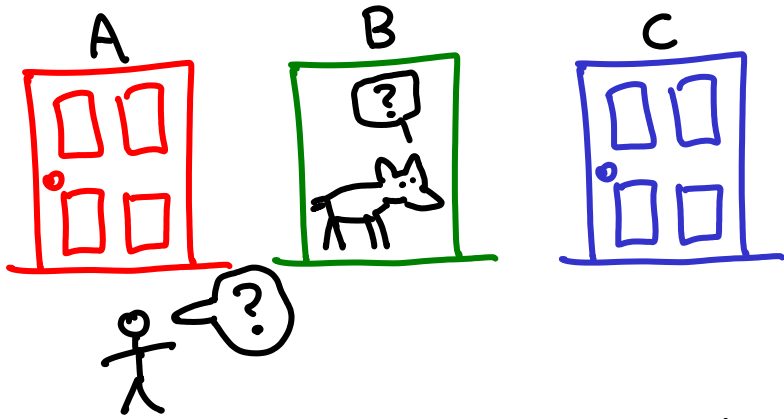

THE MONTY HALL PROBLEM

1 of these 3 doors hides a car.
The other 2 hide goats.

You get to pick a door. You randomly pick A.

THE MONTY HALL PROBLEM

1 of these 3 doors hides a car.
The other 2 hide goats.

You get to pick a door. You randomly pick **A**.

Then a door you didn't pick is opened (say, **B**) revealing a goat.

THE MONTY HALL PROBLEM

1 of these 3 doors hides a car.
The other 2 hide goats.

You get to pick a door. You randomly pick **A**.

Then a door you didn't pick is opened (say, **B**) revealing a goat.

You're given the choice: **KEEP YOUR DOOR** OR **SWITCH**

?

CONDITIONAL PROBABILITY

Roll 2 dice ...

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

If we knew that both are even, then
what is the probability that the sum is 8?

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

"prob. A given B"

$$P(A|B)$$

If we knew that both are even, then
what is the probability that the sum is 8?

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

"prob. A given B"

$$P(A|B)$$

If we knew that both are even, then
what is the probability that the sum is 8?

$$A = \{(2,6), (3,5), (4,4), (5,3), (6,2)\}$$

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

"prob. A given B"

$$P(A|B)$$

If we knew that both are even, then
what is the probability that the sum is 8?

$$A = \{(2,6), (3,5), (4,4), (5,3), (6,2)\}$$

$$B = \{(2,2), (2,4), (2,6), (4,2), (4,4), (4,6), (6,2), (6,4), (6,6)\}$$

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

"prob. A given B"

$$P(A|B)$$

If we knew that both are even, then
what is the probability that the sum is 8?

$$A = \{(2,6), (3,5), (4,4), (5,3), (6,2)\}$$

$$B = \{(2,2), (2,4), (2,6), (4,2), (4,4), (4,6), (6,2), (6,4), (6,6)\}$$

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

"prob. A given B"

$$P(A|B)$$

If we knew that both are even, then
what is the probability that the sum is 8?

$$A = \{(2,6), (3,5), (4,4), (5,3), (6,2)\}$$

$$B = \{(2,2), (2,4), (2,6), (4,2), (4,4), (4,6), (6,2), (6,4), (6,6)\}$$

$$P(A|B) = \frac{3}{9}$$

CONDITIONAL PROBABILITY

Roll 2 dice ...

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

"prob. A given B"

$$P(A|B)$$

If we knew that both are even, then what is the probability that the sum is 8?

$$A = \{(2,6), (3,5), (4,4), (5,3), (6,2)\}$$

$$B = \{(2,2), (2,4), (2,6), (4,2), (4,4), (4,6), (6,2), (6,4), (6,6)\}$$

$$P(A|B) = \frac{3}{9}$$

$$\neq P(A)$$

in this example

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

(if you want the universe to have area=1, divide all by 36.)

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

$$P(A) = \frac{\text{green area}}{\text{blue area}} = \frac{5}{36}$$

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

$$P(A) = \frac{\text{green area}}{\text{blue area}} = \frac{5}{36}$$

When we establish B then the universe shrinks.

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

$$P(A) = \frac{\text{green area}}{\text{blue area}} = \frac{5}{36}$$

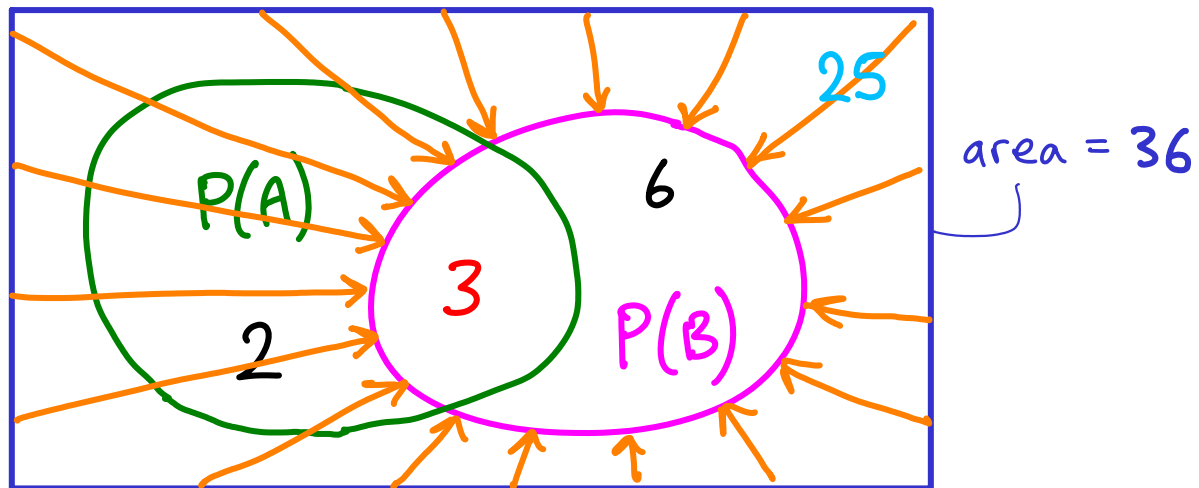

When we establish B then the universe shrinks.

The probability that A holds is normalized: $\frac{\text{remaining valid green area}}{\text{new universe (pink area)}}$

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

$$P(A) = \frac{\text{green area}}{\text{blue area}} = \frac{5}{36}$$

When we establish B then the universe shrinks.

The probability that A holds is normalized: $\frac{\text{remaining valid green area}}{\text{new universe (pink area)}}$

$$P(A|B) = ?$$

$$P(A) = P(\text{sum} = 8)$$

$$P(B) = P(\text{both are even})$$

$$P(A) = \frac{\text{green area}}{\text{blue area}} = \frac{5}{36}$$

When we establish B then the universe shrinks.

The probability that A holds is normalized: $\frac{\text{remaining valid green area}}{\text{new universe (pink area)}}$

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{3}{3+6}$$

$$\rightarrow \frac{363}{365} = P(B|A)$$

assuming 1st & 2nd differ

$P(\geq 2 \text{ people in a group of } k \text{ have same birthday})$

$= 1 - P(\text{all } k \text{ have distinct birthdays})$

$\hookrightarrow P(\text{2nd person has different bday than 1st})$

$$= \frac{364}{365} = P(A)$$

$\cdot P(\text{3rd } \dots \dots \dots \text{1st \& 2nd})$

$$\rightarrow \frac{363}{365} = P(B|A)$$

assuming 1st & 2nd differ

$\cdot P(\text{4th } \dots \dots \dots (1-3))$

$$\rightarrow \frac{362}{365} = P(C | (A \cap B))$$

etc

$$= P(A) \cap P(B|A) \cap P(C|(A \cap B)) \dots$$

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) = ?$

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) =$

$$= \frac{P[(3\text{rd} = T) \wedge (1\text{st} = H)]}{P(1\text{st} = H)}$$

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) =$

$$= \frac{P[(3\text{rd} = T) \wedge (1\text{st} = H)]}{P(1\text{st} = H)} = \frac{\frac{2}{8}}{\frac{1}{2}} \begin{array}{l} \longrightarrow \# \text{ outcomes} \\ \longrightarrow \text{sample space} \end{array} = \frac{1}{2}$$

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) =$

$$= \frac{P[(3\text{rd} = T) \wedge (1\text{st} = H)]}{P(1\text{st} = H)} = \frac{\frac{2}{8} \xrightarrow{\text{\# outcomes}}}{\frac{1}{2} \xrightarrow{\text{sample space}}} = \frac{1}{2}$$

Notice $P(3\text{rd} = T) = \frac{1}{2}$

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) =$

$$= \frac{P[(3\text{rd} = T) \wedge (1\text{st} = H)]}{P(1\text{st} = H)} = \frac{\frac{2}{8} \begin{array}{l} \longrightarrow \text{\# outcomes} \\ \longrightarrow \text{sample space} \end{array}}{\frac{1}{2}} = \frac{1}{2}$$

Notice $P(3\text{rd} = T) = \frac{1}{2}$ so knowledge of $(1\text{st} = H)$ was useless.

INDEPENDENCE

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) =$

$$= \frac{P[(3\text{rd} = T) \wedge (1\text{st} = H)]}{P(1\text{st} = H)} = \frac{\frac{2}{8}}{\frac{1}{2}} = \frac{1}{2}$$

$\frac{2}{8}$ \longrightarrow # outcomes
 $\frac{1}{2}$ \longrightarrow sample space

Notice $P(3\text{rd} = T) = \frac{1}{2}$ so knowledge of $(1\text{st} = H)$ was useless.

A & B are independent if $P(A) = P(A \mid B)$

INDEPENDENCE

Flip a coin x3 : $P(3\text{rd} = T \mid 1\text{st} = H) =$

$$= \frac{P[(3\text{rd} = T) \wedge (1\text{st} = H)]}{P(1\text{st} = H)} = \frac{\frac{2}{8}}{\frac{1}{2}} \begin{array}{l} \xrightarrow{\text{\# outcomes}} \\ \xrightarrow{\text{sample space}} \end{array} = \frac{1}{2}$$

Notice $P(3\text{rd} = T) = \frac{1}{2}$ so knowledge of $(1\text{st} = H)$ was useless.

A & B are independent if $P(A) = P(A \mid B)$
if $P(B) = P(B \mid A)$ [equivalent]

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

always

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = P(A)$$

always

if A & B independent

$$P(A|B) = \frac{P(A \cap B)}{P(B)} = P(A)$$

always

if A & B independent

alternate definition: A & B are independent if

$$P(A \cap B) = P(A) \cdot P(B)$$

apply $P(x|y) = \frac{P(x \cap y)}{P(y)}$

just moving parentheses

again, for numerator

$$= \frac{P[\text{door B was opened} \mid (A \cap \text{we chose A})] \cdot P(A \cap \text{we chose A})}{P(\text{we chose A} \cap \text{door B was opened})}$$

So far,

$$P[A \mid (\text{we chose } A \cap \text{door B was opened})]$$

$$= \frac{P[\text{door B was opened} \mid (A \cap \text{we chose } A)] \cdot P(A \cap \text{we chose } A)}{P(\text{we chose } A \cap \text{door B was opened})}$$

So far,

$$P[A \mid (\text{we chose } A \cap \text{door B was opened})]$$

$$= \frac{P[\text{door B was opened} \mid (A \cap \text{we chose } A)] \cdot P(A \cap \text{we chose } A)}{P(\text{we chose } A \cap \text{door B was opened})}$$

$$= \frac{\underbrace{\frac{1}{2}}_{\text{host picks randomly}} \cdot \overbrace{P(A) \cdot P(\text{we chose } A)}^{\text{independent}}}{P(\text{we chose } A \cap \text{door B was opened})}$$

So far,

$$P[A \mid (\text{we chose A} \cap \text{door B was opened})]$$

$$= \frac{P[\text{door B was opened} \mid (A \cap \text{we chose A})] \cdot P(A \cap \text{we chose A})}{P(\text{we chose A} \cap \text{door B was opened})}$$

$$= \frac{\underbrace{\frac{1}{2}}_{\text{host picks randomly}} \cdot \overbrace{P(A) \cdot P(\text{we chose A})}^{\text{independent}}}{P(\text{we chose A} \cap \text{door B was opened})}$$

$$= \frac{\frac{1}{2} \cdot (\frac{1}{3} \cdot \frac{1}{3})}{P(\text{we chose A} \cap \text{door B was opened})}$$

So far,

$$P[A \mid (\text{we chose A} \cap \text{door B was opened})]$$
$$= \frac{1/2 \cdot 1/3 \cdot 1/3}{P(\text{we chose A} \cap \text{door B was opened})}$$

So far,

$$P[A \mid (\text{we chose A} \cap \text{door B was opened})]$$

$$= \frac{1/2 \cdot 1/3 \cdot 1/3}{P(\text{we chose A} \cap \text{door B was opened})}$$

$$= \frac{1/18}{\left[P(\text{we chose A} \cap \text{door B was opened} \cap \text{A}) + P(\text{we chose A} \cap \text{door B was opened} \cap \text{C}) \right]}$$

could not have
door B opened
AND
car at B

The 2 terms in the denominator are "mutually exclusive", which means that they have no intersection. We can see that because one asks for A to happen, but the other asks for C to happen (among other things). In fact we should also include the term $+P(\text{we chose A AND door B was opened AND B})$ but this term is equal to zero.

Here's what is going on. There is an event, X. In our case, $X = (\text{we chose A AND door B was opened})$. We are interested in $P(X)$, as shown in orange above. We can say that $P(X) = P(X \text{ and A}) + P(X \text{ and B}) + P(X \text{ and C})$, if A, B, C are mutually exclusive and cover all possibilities. Each of those 3 terms can have different values, but they will sum to $P(X)$. Think of each term as a subset of X. (it makes sense that they are subsets of X, because they are more restrictive, and maintain all requirements of X). In fact not only are they subsets, but the 3 terms partition X. If X happens, then either (X and A) happens, or (X and B) happens, or (X and C) happens. In our case we have some additional information; X and B cannot happen.

So far,

$$P[A \mid (\text{we chose A} \cap \text{door B was opened})]$$

$$= \frac{1/2 \cdot 1/3 \cdot 1/3}{P(\text{we chose A} \cap \text{door B was opened})}$$

$$= \frac{1/18}{\left[P(\text{we chose A} \cap \text{door B was opened} \cap A) + P(\text{we chose A} \cap \text{door B was opened} \cap C) \right]}$$

could not have
 door B opened
 AND
 car at B

$$P(\text{open B} \mid (C \cap \text{choose A})) = 1$$

So far,

$$P[A \mid (\text{we chose A} \cap \text{door B was opened})]$$

$$= \frac{1/2 \cdot 1/3 \cdot 1/3}{P(\text{we chose A} \cap \text{door B was opened})}$$

could not have
